

Configure Moonshot Libraries on a Server

The Moonshot libraries need to be installed on any system running an Application/Service for which you wish to enable Moonshot authentication. These libraries provide the Moonshot GSS-API/SSPI/SASL mechanisms on the system, allowing any application that makes use of these security services to interface to the world of Moonshot. These pages walk you through configuring the libraries on a server.

Contents

- [Configure a Linux Server to connect to an RP Proxy](#)
- [Configure a Linux Server's Attribute Resolution](#)
- [Configure the Moonshot SSP](#)

Although we have separate instructions for installing the Moonshot libraries on a client and a server, they are in fact the same software packages - only the configuration steps differ.

Configure a Linux Server to connect to an RP Proxy

- How to connect a Linux server to an RP proxy

Configure a Linux Server's Attribute Resolution

- How to configure a Linux server's attribute resolution for use with server applications and services

Configure the Moonshot SSP

- How to configure the Moonshot SSP on Windows
