

Identity Selection

Users need a way of selecting the identity they wish to use when authenticating to a Moonshot-enabled service. These pages describe the three paths to identity selection: the Moonshot Identity Selector for Linux, the Moonshot Identity Manager for macOS, and the Windows Credential Manager (Microsoft only).

The Moonshot Identity Selector

- A guide for end users.

The Moonshot Identity Manager for macOS

- A guide for end users.

Windows Credential Manager

- Windows Vista onwards has shipped with an in-built utility called the Windows Credential Manager. This page describes how to use this utility to support a Moonshot environment.

Enterprise Deployment Options

- An introduction for administrators. For Linux and macOS only.
